Intelligence

<https://www.youtube.com/watch?v=6cAbgAaEOVE>

Step	Operation
1	Input j1=5, j2=3, o=4
2	Fill j1 {j1 has 5}
3	Transfer j1 to j2 {j1 has 2, j2 has 3}
4	Empty j2 {j1 has 2,}
5	Transfer j1 to j2 {j2 has 2}
6	Fill j1 {j1 has 5, j2 has 2}
7	Transfer j1 to j2 {j1 has 4, j2 has 3}

Step	Operation
1	Input j1=5, j2=3, o=4
2	Fill j2 {j2 has 3}
3	Transfer j2 to j1 {j1 has 3}
4	Fill j2 {j1 has 3, j2 has 3}
5	Transfer j2 to j1 {j1 has 5, j2 has 1}
6	Empty j1 {j2 has 1}
7	Transfer j2 to j1 {j1 has 1}
8	Fill j2 {j2 has 3}
9	Transfer j2 to j1 {j1 has 3}

Given 100000 such examples...

different combinations of input – 7 ltr and 12 ltr jugs, 9 ltr and 13 ltr jugs etc. several combinations

different output specifications – output 2 ltr, output 4 ltr, output 9 ltr etc.

Programmatically these can be generated!!??

Water Jug Problem Solved: Python

Below is the code for water jug problem in C.

```

1 def pour(jug1, jug2):
2     max1, max2, fill = 5, 7, 4 #Change maximum capacity
3     print("\n%d\t%d" % (jug1, jug2))
4     if jug2 is full:
5         return
6     elif jug2 is max2:
7         pour(0, jug1)
8     elif jug1 != 0 and jug2 is 0:
9         pour(0, jug1)
10    elif jug1 is full:
11        pour(jug1, 0)
12    elif jug1 < max1:
13        pour(max1, jug2)
14    elif jug1 < (max2-jug2):
15        pour(0, (jug1+jug2))
16    else:
17        pour(jug1-(max2-jug2), (max2-jug2)+jug2)
18
19 print("\n0\t0")
20 pour(0, 0)

```

Step	Operation
1	Input j1=5, j2=3, o=4
2	Fill j1 {j1 has 5}
3	Transfer j1 to j2 {j1 has 2, j2 has 3}
4	Empty j2 {j1 has 2,}
5	Transfer j1 to j2 {j2 has 2}
6	Fill j1 {j1 has 5, j2 has 2}
7	Transfer j1 to j2 {j1 has 4, j2 has 3}

Step	Operation
1	Input j1=5, j2=3, o=4
2	Fill j2 {j2 has 3}
3	Transfer j2 to j1 {j1 has 3}
4	Fill j2 {j1 has 3, j2 has 3}
5	Transfer j2 to j1 {j1 has 5, j2 has 1}
6	Empty j1 {j2 has 1}
7	Transfer j2 to j1 {j1 has 1}
8	Fill j2 {j2 has 3}
9	Transfer j2 to j1 {j1 has 3}

Given 100000 such examples...

different combinations of input – 7 ltr and 12 ltr jugs, 9 ltr and 13 ltr jugs etc. several combinations

different output specifications – output 2 ltr, output 4 ltr, output 9 ltr etc.

Programatically these can be generated!!?? *hundreds of programs in github :-D*

Water Jug Problem Solved: Python

Below is the code for water jug problem in C.

```

1 def pour(jug1, jug2):
2     max1, max2, fill = 5, 7, 4 #Change maximum capacity
3     print("\n%d\t%d" % (jug1, jug2))
4     if jug2 is full:
5         return
6     elif jug1 is max1:
7         pour(0, jug1)
8     elif jug1 != 0 and jug2 is 0:
9         pour(0, jug1)
10    elif jug1 is full:
11        pour(jug1, 0)
12    elif jug1 < max1:
13        pour(max1, jug2)
14    elif jug1 < (max2-jug2):
15        pour(0, (jug1+jug2))
16    else:
17        pour(jug1-(max2-jug2), (max2-jug2)+jug2)
18
19 print("\n0\t0")
20 pour(0, 0)

```

Inference – Resolution by refutation...

- (STEP 1) Pratijna: Goal: fire(mountain)
- (STEP 2) Hetu: smoke(mountain)
- (STEP 3) Udaharana:
 - haswood(x) \rightarrow iskitchen(x)
 - smoke(iskitchen(x)) \rightarrow fire(x)
- (STEP 4) Upanyana:
 - haswood(mountain)
 - smoke(iskitchen(z))

(STEP 5) Nigamana:

1. haswood(x) \rightarrow iskitchen(x)
2. smoke(iskitchen(x)) \rightarrow fire(x)
3. haswood(mountain)
4. smoke(iskitchen(z))
5. \sim fire(mountain) [**Negated goal**]
6. \sim haswood(mountain) \vee iskitchen(mountain) [1, x=mountain]
7. iskitchen(mountain) [**3,6 Resolution Rule**]
8. \sim smoke(iskitchen(mountain)) \vee fire(mountain) [2, x=mountain]
9. \sim smoke(iskitchen(mountain)) [**5,8 Resolution Rule**]
10. smoke(iskitchen(mountain)) [4, z=mountain]
11. **Empty clause** [**9,10 Resolution Rule**]

There exists x=mountain and z=mountain, such that \sim (KB \rightarrow Goal) is false \rightarrow For these values, KB \rightarrow Goal is true.

Program evolution

field of signal processing, thereby inheriting a majority of techniques in the

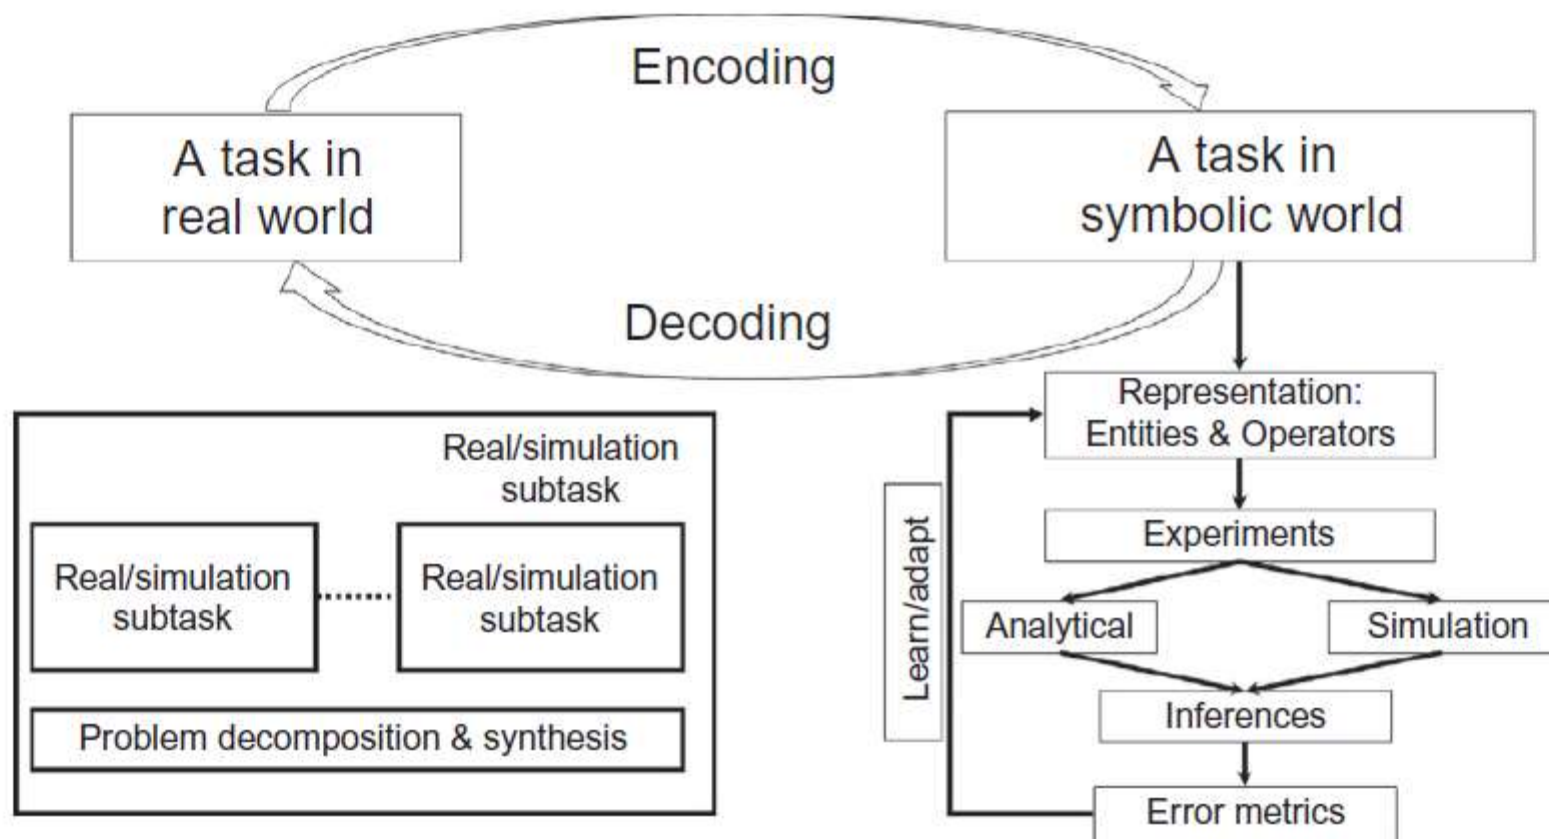

FIG. 1 Artificial intelligence framework—A real world problem or task is represented as a symbolic world problem or computer program composed of entities (e.g., data structures) and operations (e.g., algorithms). Encoding is the first step, identifying and formulating a problem statement. Experiments, inferences, and metrics are iterated at much lower costs in the symbolic world. The inferences are related back to the real world through decoding. A real world problem

Artificial Intelligence

- Dictionary: “the theory and development of computer systems able to perform tasks normally requiring human intelligence, such as visual perception, speech recognition, decision-making, and translation between languages.”

Theory of Logic

- Knowledge representation
- Reasoning
 - Deductive – Facts & Combinations of facts
 - Inductive – Interpolation, ***Machine Learning***
 - Abductive – Common sense, Exceptions

AI Types of solutions

- ANI – Artificial Narrow Intelligence
 - Machine solves specific problem
 - E.g.1 Chess game playing system
 - E.g.2 Medical diagnostic system
 - Etc
- AGI – Artificial General Intelligence
 - Machine solves diverse problems in different domains
 - System is adaptable to new environment
 - E.g. left handed driving in India → adapting quickly to a right handed system in West
- ASI – Artificial Super Intelligence
 - Automatic generation of optimization function
 - System exerting human like behaviour
 - And much more being capable of sensing trillions of sensor inputs

Simple example of state space & search..

- River crossing problems
 - One such – Man, Lion, Goat, Cabbage
 - Left to Right
 - Constraints
 - Lion eats Goat (if left alone)
 - Goat eats Cabbage (if left alone)
- C/Java program?
- $MLGC, XXXX \rightarrow XLXC, MXGX \rightarrow MLXC, XXGX \rightarrow XXXC, MLGX \rightarrow$
 $MXGC, XLXX \rightarrow XXGX, MLXC \rightarrow MXGX, XLXC \rightarrow XXXX, MLGC$

More examples of state space and search..

- Example of clinical decision support system
 - Lab reports & physiology measurements
 - Current symptoms
 - Current medication
 - Key activities of the patient
 - Health score
- Example of a Dialog system that retrieve logical inferences from knowledge base
- States and transitions are represented as a Graph
 - Nodes → Correspond to States
 - A snapshot of observations or readings
 - A snapshot of recorded facts
 - A node can be *goal* node
 - Edges → Correspond to Transitions
 - Predefined actions or moves
 - Each edge may have associated *cost*

Artificial Intelligence topics

- State space & Search – Deterministic, Randomized, Path finding
- Planning algorithms – Action space, Goal planning
- Game playing algorithms – Goal trees, Optimal strategy, Bandits problem
- Knowledge representation and reasoning, First order logic
- Machine learning, Natural language processing, Speech processing

Discussion – Interpolation vs Counting problems!

- Plain multiplication (without $\log()$ function)?
- Parity learning?
 - (input = binary string)
 - Sum of number of bits is odd $\rightarrow 1$
- Divisibility learning?
 - (input = binary string)
 - Divisible by 2
 - Divisible by 3?
 - Divisible by general K ?
- Histogram learning?
 - (input = an array of numbers)
 - Output is value range bins and number of elements in each bin
- Given an image of a face, you have to fill gaps, say fill eyes!
- Given an audio clip, you have to guess a missing part
- Given a vector you have to predict 'label'
- Learning from a set of pairs of vectors, you have to predict one given the other!
